Dhaka, Bangladesh

E-commerce Business Management System

1. Title

E-commerce Business Management System

2. Introduction

With the rapid growth of online shopping, businesses need efficient systems to manage their e-commerce operations. Managing products, customer orders, and inventory manually can lead to errors and inefficiency.

This project aims to develop a web-based E-commerce Business Management System using HTML, CSS, PHP, and MySQL. The system will help administrators manage products, customers, and orders in an organized and automated way, while providing a simple interface for users to browse and purchase products.

3. Objectives

The objectives of this project are:

- To develop a functional e-commerce management system
 - To manage products, categories, and stock efficiently
 - To handle customer registration and order processing
 - To provide an admin panel for business control
 - To ensure a simple and user-friendly interface
-

4. Problem Statement

Small online businesses often face challenges in managing their operations due to the lack of a proper system. Common problems include:

- Difficulty in tracking product stock
- Inefficient order management
- Lack of centralized customer data
- Manual record-keeping errors

This project solves these problems by providing a centralized system to manage all e-commerce activities efficiently.

5. Methodology

The project will be developed in the following steps:

- **Planning & Requirement Analysis:** Identify features and system requirements
 - **System Design:** Create UI layout and database structure
 - **Development:**
 - Frontend: HTML, CSS
 - Backend: PHP
 - Database: MySQL
 - **Testing:** Check system functionality and fix bugs
 - **Deployment:** Run the system using a local server (XAMPP)
-

6. Database Design

The system will use a MySQL relational database with the following main tables:

- **Users** (user_id, name, email, password, role)
- **Products** (product_id, name, category_id, price, stock)
- **Categories** (category_id, category_name)
- **Orders** (order_id, user_id, total_price, status, date)
- **Order_Details** (order_detail_id, order_id, product_id, quantity)

These tables will be related to ensure proper data management and integrity.

7. Requirements

Hardware Requirements:

- Computer or Laptop
- Minimum 4GB RAM

Software Requirements:

- Web Browser (Chrome/Edge)
 - XAMPP (Apache & MySQL)
 - Code Editor (VS Code)
 - Technologies: HTML, CSS, PHP, MySQL
-

8. Expected Outcome

The system will provide:

- A functional e-commerce platform
 - Admin control over products, orders, and users
 - Easy product browsing and ordering for users
 - Organized data management using a database
 - Improved efficiency in handling business operations
-

9. Timeline (3 Weeks Plan)

Week	Task
Week 1	Requirement analysis, UI design, database design
Week 2	Frontend development (HTML, CSS) + basic backend (PHP)
Week 3	Full backend integration, testing, and finalization

10. Conclusion

The E-commerce Business Management System will provide a practical solution for managing online business operations. It will simplify tasks such as product management, order processing, and customer handling. This project will demonstrate the effective use of web technologies and provide real-world experience in developing a complete system within a limited timeframe.
